Violence experiences are associated with HIV transmission risk over one year among a prospective sample of sexual minority adolescents in the United States

Joshua A. Rusow, PhD, MSW
Introduction

Sexual minority adolescents (SMA) bear disproportionate HIV risk

• Penetrative sex without condoms\textsuperscript{1-4}
• Sex while feeling the effects of drugs or alcohol\textsuperscript{1,4,5}

Established correlates of HIV risk

• Mental health symptomology (e.g. depression, anxiety)\textsuperscript{6-8}
• Minority stress and discrimination\textsuperscript{9}
• Interpersonal violence (e.g. dating violence, sexual assault)\textsuperscript{10,11}
Primary research question

How do mental health symptomology, minority stress experiences, and interpersonal violence contribute to HIV transmission risk behaviors over one year among SMA?
Methods

1,076 SMA recruited May 2018 through March 2019

• 14-17 years old
• Identify as not 100% heterosexual
• Live in the United States

Surveyed every 6 months for 3 years

Descriptive statistics and logistic regressions in Stata 17.0
Measures

Demographics

• **Age** (range 14-17)
• **Sex at birth** (female, male)
• **Race and ethnicity** (White/Caucasian, Latinx/Hispanic, Multiracial, Black or African American, Asian/Pacific Islander, Native American/American Indian/Alaskan Native)
• **Sexual identity** (Bisexual/Pansexual, Gay/Lesbian, Something else, Queer)

Mental health symptomology

• **Depression** (CESD-4; range 0-12)
• **Anxiety** (GAD-7; range 0-21)
• **Posttraumatic stress** (PCL-C; range 6-30)
# Measures cont’d—Sexual Minority Adolescent Stress Inventory

Measures cont’d – Interpersonal violence

- Physical Dating Violence
- Sexual Dating Violence
- Sexual Assault
- Forced Sexual Intercourse

Have you ever been physically forced to have sexual intercourse when you did not want to?

During the past 12 months, how many times did someone you were dating or going out with...

...physically hurt you on purpose? (Count such things as being hit, slammed into something, or injured with an object or weapon.)

...force you to do sexual things that you did not want to do? (Count such things as kissing, touching, or being physically forced to have sexual intercourse.)
Measures cont’d – HIV transmission risk over the following year

Combined experiences at the 6-month and 12-month follow-up surveys

“Since the last time you took this survey on [date] have you had sex...”

• with someone without discussing their HIV status?
• with someone without using a condom?
• while feeling the effects of drugs or alcohol?

Sex before Discussing HIV Status

![Graph showing sex before discussing HIV status for different demographics.](chart_image)
Penetrative Sex without a Condom

- Age: 1.452
- Male: 1.141
- Female: 0.774
- Black or African American: 1.066
- Latino/Hispanic: 1.502
- Multi-racial: 1.232
- Bi/Trans: 1.535
- Queer: 0.988
- Other: 0.926
- Nothing: 0.863
- SMASI: 1.005
- IPV: 1.478
- GAD: 0.955
- CESD: 0.996
- PCLC: 1.042
Sex while Feeling the Effects of Drugs or Alcohol

![Graph showing the percentage of people engaging in sexual activity while under the influence of drugs or alcohol.](chart.png)
Conclusions

Experiences of interpersonal violence precede reports of sexual behaviors that put SMA at risk of HIV transmission over the following year.

The relationship between HIV transmission risk and minority stress or mental health symptomology largely wash away when considering IPV.
Future Directions

Next steps
• Latent factors
• Mediation
• Additional measures of IPV (e.g., perpetration)
• Substance use

New questions
• Are more anxious SMA reporting less sex, overall?
• Are subscales of minority stress better predictors?
• Where are SMA learning about relationships and sex?
